

Lineup-Mate Effect: Cross-Stat Dual-Direction Structure

NBA Projections diagnostic · n=167 players · 20260427T014810Z

For most stats, the lineup-mate effect on a focal player's year-over-year change has OPPOSITE SIGNS depending on where that player sits in the population's baseline rate.

Specialists (top-25%) and role-players (bottom-25%) react to the same lineup change in different directions — a uniform context layer would average the signals to zero.

Phase 4 architecture: player-baseline-conditional interaction.

Three regimes:

Specialist-positive / role-negative: REB · OREB · DREB

Pace-driven + zero-sum usage: PTS · AST · TOV · FGA

Specialist-insulated (no lineup feature): BLK · STL · FG3A

Lineup-Mate Effect Varies With Player Baseline · Sign-Flip Reveals Phase 4 Architecture
